THE RIGHT STUFF...

www.JP-AUSTRALIA.com
SIMPLY RADICAL

French WIND magazine fired the event for its “breakers” and because it “offers radical rides in all types of conditions”. And British WINDSURF states that the “cruising line and responsive user almost supernatural” and “in clean cross-offshore conditions, it was simply a revelation”.

Morgan Noireaux sailed a Radical Thruster Quad to win the only true down-the-line PWA wave event – the Aloha Classic – two years in a row.

The deep double concaves in the bottom are the distinguishing shape details of this design. Their deepest parts sit right under the straps creating long flat planing sections. Together with the wingers – which slightly widen the planing surface – these concaves enhance acceleration to a surprising speed. You'll enjoy the fluid and “light” feel based on the very short wetted planing area.

The Vee cushions the ride and creates a well rounded bottom curve at the rails. As a result, the board turns tight easily offering ultimate rail bite. The inexperienced wave rider will consider the board’s speed of reaction as nervous, while the targeted, advanced wave rider will love this liveliness, just as much as he will adore the super fast change from rail to rail.

The boards come with the proven quad fin setup enhancing the grip and drive in fast wave turns. The rear center fin box for a thruster setup can be used for more power in tight or side shore conditions or for more control in real big waves – currently Jason Polakow’s favorite setup for big waves and Antoine Martin’s favorite setup for European PWA events.

>> According to our pro riders unmatched for real down-the-line wave riding! You'll be blown away by your high speed carving top and bottom turns. The board provides all the needed grip, control and liveliness throughout your wave moves. It rewards an active riding style with turns that you used to dream of. Every advanced wave rider will simply love them as they take his riding to the next level. Go and get radical!

The boards additionally come with plugs to cover all fin boxes.

PRO EDITION in S-Glass Technology with Stringers and basalt rails.
**FAST WAVE ALL-ROUND**

This has been our best selling wave line. Because of its overall wave performance, control and versatility it can be used anywhere at anytime by anybody.

British WINDSURF confirms that it is "...very fast! And combined with control comes the ability to sail in an explosive, expressive manner". French WIND appreciated its performance in side and side onshore.

The bottom includes a moderate version of the Radical’s deep double concaves and therefore features similar virtues: it is JP’s fastest wave all-rounder in a classic shape. The progressive line towards the tail results in a rather rockerized rail line which – together with the additional curve in the outline – enhances the overall maneuverability. The speed it carries smoothly into the turn, its precise carving and instant response makes it shine in powerful side offshore conditions as well as it suits eastern waves.

Compared to the Slate, this all-rounder has a gunny appearance resulting in an easy, very reliable, traditional wave board feel. Its predictability and control in a wide range of conditions are its strength!

The Thruster Quad is a fast and exciting board which builds up speed rapidly and feels lively and exciting. The speed potential comes from the flat bottom line inside the concaves under the foot straps lifting the board onto the plane early and accelerating rapidly. You can exploit its velocity in all water states to launch off every wave to insane height and thus it even qualifies as bump and jump high wind board.

This season the boards come with a bigger tail fin resulting in earlier planing and more drive. The additional rear tail fin boxes allow to experiment with a quad setup for additional control and tighter turns.

**THRUSTER QUAD**

This fast wave all-rounder can be tuned to suit all wave conditions. It offers a huge range of use, is great fun in small waves and also performs in big rollers. It provides the speed to launch off every ramp explosively and to fly seriously high.

**JP WS brochure 2018.indd   5-6  02.08.17   16:25**
A NEW DIMENSION OF ALLROUND WAVE

We developed 3 totally new shapes for 2018. The concept is still based on a parallel outline which is the foundation of this board line. It makes the board increase speed, resulting in more speed and earlier planing while its short length makes critical, tight turns feel very natural.

It offers the most efficient volume distribution possible and makes the board extremely stable, even when not planing. This means that the boards will be shorter and narrower than previous concepts. The swing weight is more centered, speeding up rotations and change of direction.

We reduced the board’s nose and tail width. The narrower nose in combination with additional rocker in the front gives you a safer feel on the wave during turns and when lining up jumps. The smaller tail makes the board more versatile on the wave face and going vertical very easy.

The bottom shape includes various V and concave shape concepts. The nose entry and front section of the board is equipped with strong V for a soft entry. Between the foot straps we use a deep single concave which creates a flat section. Due to the channel effect of the concave the water accelerates and provides additional lift for early planing and high speed. Towards the tail we use a flat V for great water release.

The new Wave Slate uses in general a flatter rocker along the center line than the previous generation. This increases early planing and speed performance. The stronger V definition and narrower outlines at nose and tail give the board a curvier rail line compared to the first generation. The combination of the above-mentioned shape features gives the boards 2 totally different rocker lines.

The center line is quite flat and responsible for its speed and early planing performance. Once railed up, the curvy rail line takes over and delivers outstanding maneuverability. This bottom concept is widely used in surf boards and the performance is proven. The result combines the surf board feeling with the performance expected from a modern windsurf board.

The boards come with a thruster fin setup but the hull is equipped with 2 Mini Tuttle and 3 Slot Boxes. It opens up all trim options and suits every rider’s style.

>> Our goal was to widen the range of use and deliver outstanding performance in any conditions and we are proud to say that this is JP’s best-ever wave all-rounder.

The boards additionally come with plugs to cover all fin boxes.

- Alternative Multi Wave fins for Quad setup

VOLUME LENGTH WIDTH WEIGHT FINS**** FINS*****
The FWS boards come with Powerbox only and a 2cm longer single fin than the PRO models and they are great bump&jump blasters. The PRO boards additionally come with Mini Tuttle sidefin boxes, thruster fins and covers for the sidefin boxes when used as single fin. They are exceptional toys for all conditions, yet, they offer huge potential for further fine-tuning and thus increasing the fun and the performance in the whole range of use.

**FWS = FULL WOOD SANDWICH Technology (single fin)**

---

**A NEW DIMENSION OF ALL IN ONE**

The all new versions of these best sellers are a must have for anybody who is looking for a medium to highwind all-round board. Werner Gnegger merged the advantages of the new Wave Slate with all the great abilities of the former Freestyle Wave generations. This makes them not只 limited to great manoeuvrability or all water fun even they excel in the flats, fly over chop, carve in waves and are a thrill to ride.

The new Outline for 2018 is more parallel in the midsection creating additional surface area for better planing and more stability. The tail width only got marginally wider to maintain the excellent control on fast runs over troubled water. The “shorty” is more agile, quicker to respond and it also carves better in small waves without getting stuck.

The bottom features a newly developed flow combined with concaves. The double concaves in the nose takes care of the comfort. It then transforms into a flat Vee under the straps which makes the board ride high and fly smoothly over chop. The flow steadily increases towards the tail which creates more rocker in the rails. When carving the rocker of the curvy rail line delivers outstanding manoeuvrability. Due to the grip provided, you can carve as radical as you dare.

The domed deck grants a comfortable stance for all footstrap positions. The deck shape also offers perfect board control mixed with readiness to respond.

The PRO = PRO EDITION Technology (thruster fin setup)

**PRO = FULL WOOD SANDWICH Technology (single fin)**
Success continued for JP’s Freestyle team in 2016 with 2 riders on the PWA podium - Amado Vrieswijk NB-20 and Yentel Caers B-16. Steven Van Broeckhoven won his 5th EFPT title and French youngster Sam Esteve F-79 finished 5th overall in his first full year on the European tour.

For 2018 the biggest and smallest sizes have been updated so that the whole freestyle line has the latest compact shortboard look with its awesome handling.

Impressive, high scoring moves require faster rotations. Therefore, all the swing weight is centered close to the mast base and turning point of the board. Due to the compact setup the riders stand close to the rig in a very comfortable stance. This is very important not only for big moves but also for sailing in regular stance or when going switch.

Our riders love the board’s higher water position and looser ride. The new bottom concept has a new V-flow to create enormous lift underfoot and to achieve higher top speed and instant pop.

They are stable wide platforms to cover the biggest possible range. The centered volume distribution is the basis of all our Freestyle boards. The outline is rather parallel in the mid-section to maximize the planing surface. The rounder outline towards the tail improves maneuverability and unmatched pop not just for your first jump but also for your following air moves performed during combination moves.

Impressive, high scoring moves require faster rotations. Therefore, all the swing weight is centered close to the mast base and turning point of the board. Due to the compact setup the riders stand close to the rig in a very comfortable stance. This is very important not only for big moves but also for sailing in regular stance or when going switch.

>> The compact Freestyle boards accelerate superbly for powerful jumps. The shortness of all the shapes enhances the handling in all moves and speeds up all rotations. The lively and direct feel impresses confidence so that amateurs and pros alike will pull-off more moves in greater style.

### Freeride Classic M

These two multipurpose, medium wind freeride shapes unite the advantages of the maneuverable and agile Freestyle Waves with the performance of the fast Super Sport boards. They plane early, are comfortable to ride and really fast. But most of all they feel sporty as they deliver an electric feeling when crossing of high speed and carving hard.

They also come with a “classic” outlines and thus feature all the virtues that traditional shapes have ever the new modern widebody freelboards: They feel and ride very predictable as you knew it from your previous freeride boards.

**Sporty freeride classic for medium winds.** It is an absolute pleasure to ride them in flat water and chop as they combine a great speed potential with control and comfort. They will encourage you to push your limits and also to carve lines in some open ocean swells. Plug and play windsurfing - jump on and have fun.

### Freeride Classic L-XL

The named L-XL ride结合了冲浪板和冲浪板在轻至中等风速下的冲浪性能和“plus”版本是12年来的最新概念，即经典的形状。

Year after year magazines confirm the outstanding qualities like the French WIND magazine thinking that its traditional shape cannot disappoint and it hits “the heart of responsive and evolutionary freeride boards”.

**Sporty freeride classic for light winds.** Good comfort and unrivalled control come packed with early planing and sporty acceleration already in marginal winds. It suits most recreational windsetters as it is very forgiving in the turns to soothe the novice during his tentative jibe approaches and at the same time aggressive for the advanced sailor who will carve the board though the turns on its rail. Being narrow, they cushion chop competently and feel very comfortable. You step on them and feel immediately at home.

MIGHTY MAGIC

They do everything exceptionally well while everything is exceptionally easy! These wide, short and thin boards provide the best early planing, an exciting ride and unbelievable jibing abilities for all rider levels. Playful and small, they oil high in the water, delivering the lively and sporty feel which makes windsurfing so exciting.

The new 112 follows the shape amendments of its brothers. Now all 7 models provide a high water position, giving them a lively ride and improved performance. The 112, like the 119 and 130, is a lively, agile, sporty freerider which simply planes better, rides more comfortably and jibes much easier than comparable, traditional boards. The 97 and 103 are more stable and controllable and are easier to control compared to Freestyle Waves or All-Rides of the same size. They also planes earlier and requires less input from the rider. Up to the 130 they are lively, sporty and fast widebody freeriders. The 142 and 154 were shaped with the beginners and intermediates in mind and are even more forgiving and comfortable. They all planes unbelievably early for their size. The performance and top speed of the 2nd shape generation also improved simply because of the light and easy handling when blasting along. Flying on the fin they provide directional stability and the vee and double concaves seem to run out all chopp.

The two new Magic Ride Family models come with a center fin and 2/3 of the deck has an EVA Pad making them great boards for the whole family.

When swapping from traditional narrow boards you have to get used to the ride and feel of the new wide body boards. Once you slightly adapt your style you will be rewarded with a magic ride and will probably never want to go back.

To select the right board size look at the width of traditional "narrow" freeriders or go for about 10-15L less volume to get the same range. The Magic Ride will feel smaller and more compact and will glide like a smaller board. It pretty much just flies by itself. Push the rail and it will carve predictably, smoothly and incredibly easy. No matter if you are just starting to jibe and need forgiveness or if you want speed and performance – which is where the 2nd generation excels as they can come harder and tighter and exit with more speed. They are magic!
**BLISTERING FAST**

Powerful and very fast. These boards make you fly over the water. They are aimed at sporty, advanced riders who have the ability to unleash the full potential of their acceleration and speed. These riders will enjoy the very carve-like feel of the boards. These are the fastest Super Sport boards ever and will blow your mind and your friends off the water.

They deliver explosive acceleration and electric flying speed like World Cup Slalom boards but are easier to get going and are more comfortable to ride.

British WINDSURF magazine thinks that it is “even softer” and “velvety off the wind” and provides “plenty of traction and control to really control the flight”. French WIND magazine states that the Super Sport “gained in liveliness to play with the competition without losing its accessible side – the big plus of the JP”.

They are short and wide, with parallel outlines and big planing surfaces to lift the boards up onto the plane instantly. The centered volume increases top end control. Additionally, the concave deck around the mast base lowers the rig which also improves control.

The super loose ride and higher water position is based on the bottom shape - a combination of flat sections, concaves and various V flows produces additional lift right under the straps. Therefore they feel very light under foot flying over chop and offer a great sailing sensation!

The cut-outs create basically two outlines for the board. The wide one in the deck gives you a very powerful stance and you can push your board to maximum speed. The narrow one in the bottom reduces the tail lift resulting in a much smoother ride and better control.

The cut-outs also create thin rails which makes it easier to rail up the board at high speeds and come through like this. They come with a very comfortable deck shape. The high standing position offers more leverage, creating loads of fin pressure for instant acceleration and top end performance. For the advanced rider the outboard footstraps are further back while the intermediate rider will prefer the more forward, inward position for easier strap access.

NEW: The Medium Tuttle Boxes are specially reinforced and are approved for foils with a Deep Tuttle base. These “streetracers” now also perfectly suit the new Hydrofoiling trend!

FAST IN ALMOST NO WIND

This lightwind board will blow your mind as it gets going in almost no wind, reaches top speed immediately and is comfortable, smooth and easy to sail for a high performance freeride board of this size.

The cut-outs and bottom shape create the ‘tighter feel’ of a much smaller board and a lively, thrilling ride. You have to try it to believe how much fun you can have in almost no wind.

Werner Gülder's 4th generation of the Super Lightwind combines shape details from his latest Slalom, Super Sport and Formula development. It feels compact due to its short length and is equipped with a wide nose and a parallel waterline through the mid section giving it the maximum planing surface.

Double concaves in the bottom under the straps create maximum lift and acceleration. The hulls also help to push the board onto the plane. The efficient bottom shape provides a super lively and exciting riding sensation.

The cut-outs create basically two outlines for the board. The wide one in the deck gives you a very powerful stance and you can push the board to maximum speed. The narrow one in the bottom reduces the water surface area and the enormous amount of pressure produced by modern fins can release easily. Therefore, the board feels stable and forgiving even in bolt-on fin mode. The smooth and controlled ride encourages the rider to push for unlimited speed. The smooth and controlled ride encourages the rider to push for unlimited speed. The cut-outs also create thin rails which makes it easy to rail up the board at high speeds and carve through the jibe.

Due to the low volume, width and dynamic lift of the tail, initiating the jibe requires little effort and guiding this wide board on its rail through the turn is easy. The concave deck lowers the mast base and reduces the swing weight in the nose area. It also allows the rider to keep the rig more upright, which creates more downforce to keep the board nicely trimmed on all courses.

The deck shape delivers great comfort as the high-standing position offers good leverage, creating loads of fin pressure for instant acceleration and top end performance. The advanced rider will prefer the outward footstraps which are further back while the intermediate rider will enjoy the more inward and further forward position which makes it very easy to get in and out of the straps.

NEW: The Medium Tuttle Box is specially reinforced and is approved for foil with a Deep Tuttle base. This “lightwind powerhouse” now also perfectly suits the new Hydrofoiling trend!

SUPER LIGHTWIND
JUST LIKE FLYING!

HYDROFOIL 135

This all-rounder makes foiling easy and accessible for everyone who wants to experience the feeling of flying over water. At the same time, it is a very efficient racing machine. It has a shape that suits all races, from beginner to professional and it covers a very wide wind range.

The compact design has a wide tail and parallel outline. The even nose rocker combined with a soft tail box in the front makes for a smooth and forgiving touch down which is essential as beginners tend to nosedive. This special nose does not dig into the water but will softly bounce you back up to keep you flying.

The even volume distribution provides a good glide before the board lifts out of the water and great balance once up in the air. The tail cut-outs avoid drag as the board starts to fly. The tail shape in the standing area is different to Slalom and Freeride boards to cater for the more upright stance when foiling.

The streamlined surface prevents the board from getting affected by big gusts. Compared to our 155 the 135 has a slightly bigger range in higher winds as its nose stays a little lower when flying, so the board is therefore easier to control.

HYDROFOIL 155

A high performance foil board with an extra wide tail area providing a large planing surface and good leverage to lift the board up. Compared to the 135 it is bigger and is obviously slightly more orientated towards lighter winds and upwind sailing.

For deep downwind courses, there is an additional set of straps in the center of the tail. You will stand closer to the center of the foil and further back to control your flight over the chop.

The high angle tail cut-outs are designed to minimize drag during occasional tail touch. The nose area features a convex, round rail profile and this together with V-angled rail bevels eliminates any hard edge to catch the water in case of extreme touches down and prevents catapulta. The special cross section, called Neutral Flying Profile, reduces changes of the foil lift with change in roll angles - an extremely important feature on a foilboard as much more exposed to the wind than a regular board.

>> Both boards are much easier for foiling than normal slalom or freeride boards as they offer a comfortable stance and enough leverage to handle the lift. Once up, they fly neutrally so that you can fully concentrate on controlling the foil. The hulls create the little resistence in the air as possible, which is very important when you are flying.

The boards come with a special, reinforced Medium Tuttle Box. And yes, you can also use them with normal windsurfing as the box also fits every normal Tuttle or Deep Tuttle Fin. They feel and perform like shorter versions of a Super Lightwind.

VOLUME LENGTH WIDTH WEIGHT PRO WEIGHT PRO WEIGHT PRO WEIGHT

PRO = PRO EDITION Technology
FWS = FULL WOOD SANDWICH Technology
ES = EPOXY SANDWICH Technology
**READY TO RACE**

Designed for the highest slalom competitions in the world, they are incredibly fast! The control and comfort of these boards are key to top-speed. They impress with their aggressiveness in jibes and the quick acceleration out of the turn.

Slalom board development never stops. Throughout the year prototypes are tested at various locations and World Cup venues to ensure that new boards excel their predecessors in all conditions. The overall performance of our 2017 boards is already so high that we only need to introduce 2 new shapes for 2018 – a totally new 71 and 85.

The basic design of the JP Slalom boards is a short compact shape with a parallel outline which maximizes the planing surface to lift the boards onto the plane instantly. The special tail cut-outs create two outlines. The deck outline is wider – enabling the rider to push hard against the fin - resulting in better acceleration and a looser, faster ride. The narrower bottom outline reduces the wetted surface and lowers the drag. You basically ride on a smaller board. This narrow bottom tail creates a lot of outline curve which allows the rider to trim the board perfectly and steer it with little effort. For more flotation and better acceleration of the two new boards, the depth of the cut-outs was reduced: The 85 and 71 will feel more powerful at the wind limit.

The bottom features a combination of a flat mid section, with Vee further forward and towards the tail. The flat section between the strap produces additional lift which lets the board fly. The tail Vee makes it easy to initiate your jibes and opens up the rail lines, releasing pressure and activating the curved rail rocker when turning or jibing. Speeding in chop becomes more controllable since the rails don’t catch and the board flies effortlessly.

Due to the ergonomic deck shapes, the rider can push hard and feel very connected. The larger sizes have fuller rails for better leverage while the ride of the smaller boards become more maneuverable since the rails don’t catch and the board flies effortlessly. The concave deck reduces the swing weight and lowers the rig position for improved control.

The 3 high wind boards 55, 60 and 62 not only cater for intense Slalom racing but are also perfectly suited for Nicolas Warembo’s favorite Long Distance Race: the DEFI Wind.

**NEW:**

- All Slalom boards come with double hole footstrap plugs to use four screws with every strap for perfect connections between rider and board.
- All fin boxes (except the Slalom 55) are specially reinforced Medium Tuttle boxes and can take big fins and now even foils with a Tuttle and Deep Tuttle base.
- All Slalom boards come with double hole footstrap plugs to use four screws with every strap for perfect connections between rider and board.

* estimation
For that daredevil inside you! There is nothing like the feeling of flying down a speed course totally maxed out and being right on the edge. This is what these boards are made for. They are designed and developed for those who have the guts to sheet-in – no matter what.

Rocket-like acceleration, super loose feel and almost unlimited top speed. This is what these boards are made for. Take the biggest sail you can possibly hold, sheet in and experience the feeling of flying down a speed course – totally maxed out and right on the edge. Hans Kreisel proved with the JP Speed 45 that these boards can handle and control speeds up to 100 km/h and more which imposes confidence when the fear level might take over. They are designed and developed for those who have the guts to constantly push their limit.

The super fast 50 fits in every speed sailors quiver and the 54 offers more power for light wind speed sailing. This shape looks substantially different to all previous JP Formula designs with a shorter hull, a more parallel outline and a squared off nose. Thus, the rider can make use of the longest possible parallel rail line on the upwind course. At the same time, it produces a very stable platform on the downwind legs producing efficient lift to fly over chop. The entry and nose rocker are well pronounced in order to make the ride over chop safe and fast.

The deep concave on the deck lowers the mast base and reduces the swing weight in the nose area. You can keep the rig more upright, which adds efficiency and creates more down force keeping the board nicely trimmed on all courses. In the bottom, double concaves under the straps maximize lift and acceleration. On upwind, you can use the long waterline length. Downwind, the wetted surface can be reduced by railling up the board and only riding on a narrow section.

The tail shape features two cut-outs for the most efficient water release and to substantially reduce the lift at the tail. The continuous standing area offers better leverage to channel the fin power into acceleration and speed. The fastest JP Formula board – ever. Ready to race!

**YOUNG GUN**

Specially designed according to the needs of the new generation, these boards feature a reduced stance width and a shorter distance between footstrap plugs for more narrow feet and also with many different footstrap options for youngsters of all sizes and sailing levels. They work for young guns up to around 50 kilos.

**YOUNG GUN RADICAL THRUSTER QUAD**
The scaled down version of the board that won Morgan Noireaux the Aloha Classic - features all the shape details of its bigger brothers: Deep concaves under the foot straps which create a long flat section for great acceleration and speed. Once railed up the curvy rail line takes over and easily slices the water. A new dimension in grip, control and speed throughout your wave moves. A super soft tuck line with slightly reduced width makes the board respond a lot quicker and changing from rail to rail is faster. It delivers unmatched performance for both young guns and is a great kids toy.

**YOUNG GUN MAGIC RIDE**
This shape is very wide providing stability. Youngsters also get on the plane much quicker and initiating turns is easy due to the round outlines.

**YOUNG GUN AIR**

**YOUNG GUN AIR INFLATABLE**

*Awesome handling advantages: It can be rolled up and fits into the backpack it comes with – no more need for a roof rack for transport and no big garage for storage. It is also considerably lighter than any hardboard of this size. For paddling you could even take it in the backpack to the beach with your bike. The high tech drop stitch technology makes it so stiff that you will easily get it riding but the surface itself is so soft that you won’t hurt yourself when falling on it. Instead of a daggerboard the additional center fin provides directional stability to reduce side drift and helps to go upwind. Being longer than the normal Young Guns also helps with going upwind due to its longer waterline length. This board offers so much fun and is a great kids toy.***

**ES** = EPOXY SANDWICH Technology

**INFLATABLE Light Edition Drop Stitch Technology**
**BIG NEWCOMER**

They provide superior stability and easy handling which the beginner needs! After only a few hours everybody will be sailing back and forth. Yet, they are more than pure beginner boards as they can get you onto the plane like a large freeride board. Consequently they are excellent beginner and family boards, also offering fun to the intermediate rider. They all come with comfortable EVA decks, footstrip options for all rider levels and indestructible, detachable fiberglass nose protectors.

The 180 has a wide range of use. From beginner boards for kids and lightweights to sporty cruisers for more advanced riders.

The 190 and 205 are perfect beginner boards which turn nicely – an advantage especially in light winds.

The all-new 240 is clearly longer than its brothers providing superior directional stability. Due to the enormous width over the whole length and its fuller rails, the high volume makes it super stable - even for the heaviest newcomers.

ASA SANDWICH Technology with full EVA deck and integrated carrying handle.

ASA SANDWICH Technology with full EVA deck, nose protector and a carrying handle on the nose and tail.
Inflatable boards offer clear advantages over hardboards: they are super comfortable and user-friendly as they are easy to transport and store. So far, their only real disadvantage was their limited planing potential.

Now JP presents two all-new inflatable windsurf boards which are specially developed and tuned for planing!

The specially developed, super clean hard rails are covered by a fiber reinforced layer of PVC, thus creating a smooth and efficient water release. Thus, the boards plane freely, accelerate willingly and reach good speed with little drag — similar as you know it from freeride hardboards. You’ll be surprised how much fun they are!

They come with Pre Laminated Triple Layer Composite Drop Stitch, Fiber Reinforced Stringers in deck and bottom and Triple-Layer Rails and will surprise you with their stiffness. The special, fully integrated Powerbox is very stiff and strong. The boards come with four easy-to-mount footstraps and offer strap positions for advanced riders and beginners.

The soft hull is covered with a large, slip-proof EVA sheet for unmatched comfort. You also don’t have to worry about mistakes anymore because you won’t get hurt when falling on it. Rolled up, the boards fit into a backpack — no more need for a roof rack for transport or a big garage for storage.

The fact that they are slightly softer than hard boards makes them great jibers as they can give a bit in the turn, almost providing the feeling of a self-adapting rocker line.

The dimensions of the MagicAIR resemble those of a modern freeride shape and accordingly it has a similar performance and a short-board feeling. It addresses the intermediate to advanced sailor with mainly planing on his mind. Nonetheless, it has more volume than a hardboard of the same size, making it easier and more forgiving.

Inflatables have clear advantages over hardboards: they are super comfortable and user-friendly as they are easy to transport and store. The only real disadvantage was their limited planing potential.

WINDSURF SUP

WINDSURFING SUP

Windsurfing and stand-up paddling: The board is an ideal family toy which works equally well in both sports as a pure beginner board as well as fun board for the advanced. It’s big fun and can get you on the water at any time – for fun, adventure or for a workout – or all together.

Plenty of length and volume offer extra stability. It comes with a fully retractable dagger board, which provides stability and makes it effortless to sail upwind. While it works great for flat-water paddling or a first windsurf session on flat water, it can also be used in small waves – for both sports.

VISION: 2 RIGS FOR BEGINNERS, INTERMEDIATES AND SCHOOLS!

The VISION rig is efficient and durable. The moderately loose leech allows the sail to perform also when the wind picks up a bit. One set contains a sail, a boom with uphaul, a fitting two-piece mast and mast foot and the whole rig comes in a nice bag for easy storage and transport.

The VISION-X rig offers 2 main advantages: The sail has fewer battens for lighter and optimized handling. It also comes with a 3 respectively 4 piece mast so that it can be stored in the smaller package than you considered possible! The ultimate in storage and transport.

Both rigs remain unchanged and feature a full-Dacron® sail with PVC window which is light, strong, UV resistant and very durable for everyday use. The use of the Vision rig last year in windsurfing centers all over the world was definitely the toughest test! The soft sail material provides great feedback for beginners and is very forgiving at the same time.

Sail features for durability and against wear and tear:
- FULL DACRON® SAIL WITH PVC WINDOW (NO MONOFILM!)
- PLASTIC BATTEN PROTECTION
- BLIND-STITCHED FOOT AREA
- REINFORCED CLEW
- PADDED MAST FOOT PROTECTOR
- LIGHT FIX-TOP

**SAIL** MAST BOOM BATTERIES BAG-SIZE RIG INCLUDES
VISION 1.5 2pc Epoxy 228 cm 100-140 cm 3 (+1) 140x40 cm Epoxy mast, mastbase cup, adjustable boom, uphaul, equipment bag
